S2465-2

ILLINOIS POPULATION TRENDS FROM 1970 to 2025

1984 Edition

State of Illinois
Bureau of the Budget
July 1984

STATE OF ILLINOIS
EXECUTIVE OFFICE OF THE GOVERNOR

BUREAU OF THE BUDGET

SPRINGFIELD 62706

To The Reader:

This book contains population projections for the State of Illinois and its constituent counties. These projections reflect the probable trends of population growth, changes in age composition, and other population characteristics in the State. They provide a crucial demographic foundation from which a broad spectrum of planning policies and programs can be meaningfully based.

These projections have been developed utilizing the most current historical information and the final 1980 Census count. They are to serve as the official source of population data and are to be used whenever appropriate by all State agencies, boards and commissions. Variations from these projections must be submitted to the Division of Planning and Financial Analysis located in the Bureau of the Budget with detailed supporting information and be approved prior to use.

Thank you for your consideration.

Respectfully submitted,

Robert L. Mandeville
Director
Bureau of the Budget

These projections have been prepared by Dawn Rowe under the general direction of Dr. Cheng H. Chiang and with the assistance of Eric Albin of the Divison of Planning and Financial Analysis, Bureau of the Budget.

Please address all questions relating to these population projections to:

Dr. Cheng H. Chiang or Dawn Rowe
Division of Planning and Financial Analysis
Illinois Bureau of the Budget
605 Stratton Building
Springfield, Illinois 62706
Telephone: 217/782-3500

This publication has been financed in part through a manpower planning grant from the Department of Commerce and Community Affairs pursuant to provisions of the Job Training Partnership Act.

IV.	Appendix 1: Methodology	233

ILLINOIS POPULATION TRENDS

Introduction

Since 1973 the Illinois Bureau of the Budget has published uniform, most probable projections of demographic characteristics for the State. Mandated for use as a guideline for all agencies, boards and commissions of state government, these projections have also been utilized by a variety of sub-state regional planning organizations and local governments, as well as by many private industrial groups.

This volume, the eighth in the series, incorporates total population counts from the 1980 Census and the latest available data concerning trends of fertility, mortality, labor force participation rates, and employment growth. Consequently, the population projections presented herein are updated versions of those projections published in July 1982. Differences between the two are primarily caused by changes in the estimates and projections of employment levels and labor force participation rates. A detailed description of the assumptions and methodology used in making the projections is contained in Appendix I.

Data Revisions and Current Population Projections

The final count of the 1980 Census of population has served as a new data base for population projections. Final estimates of employment by industry for 1981 and preliminary estimates for 1982 were available for use in the current population projections. Prior to this time, preliminary 1981 data served as the latest observation of employment trends. In preparing the employment projections, the recession, which lasted from 1980 to 1983, has been taken into account. Due to the slow employment growth and the high unemployment rate that the recession has contributed, net out-migration has persisted into the early 1980s. In view of the migration trend and the lower job level, the assumption of migration for current population projections is different from previous population projections.

Barring catastrophies or drastic technical and economic changes affecting the Illinois and U.S. employment and population distribution, the current population projections represent the State's most probable population trend and should provide a sound basis for future planning.

Historical Population Trends in Illinois, 1950-1983

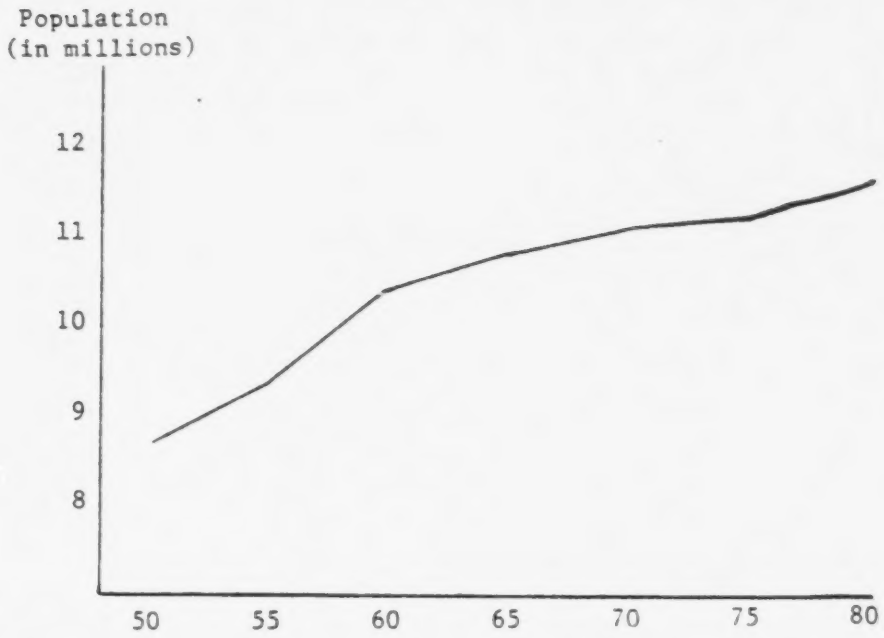
To understand future population trends in Illinois, it is necessary to examine historical trends, for population growth and demographic characteristics in the future are to a large measure governed by those of the past.

From 1950 to 1980, Illinois' population grew substantially from 8.8 to more than 11.4 million (Figure 1). During these three decades, Illinois' total population grew 29.5 percent. Much of the growth, however, took place in the

period 1950 to 1970 during which an increase of 26.1 percent was recorded. Illinois' population remained relatively stable from 1970 to 1980. The 1980 Census of population shows that Illinois population increased by only 2.8 percent from 1970 to 1980. It should be stressed that this percentage increase over the ten years is somewhat inflated due to the 1970 to 1980 change in undercount. Were it not for the improvement in population undercount in the 1980 Census, an increase of around 1.2 rather than 2.8 percent would most likely have been observed. The most current population estimates show that population growth in Illinois for 1980 to 1983 is even slower than in the decade of the 70s.

Figure 1

ILLINOIS OPEN POPULATIONS: 1950-1980

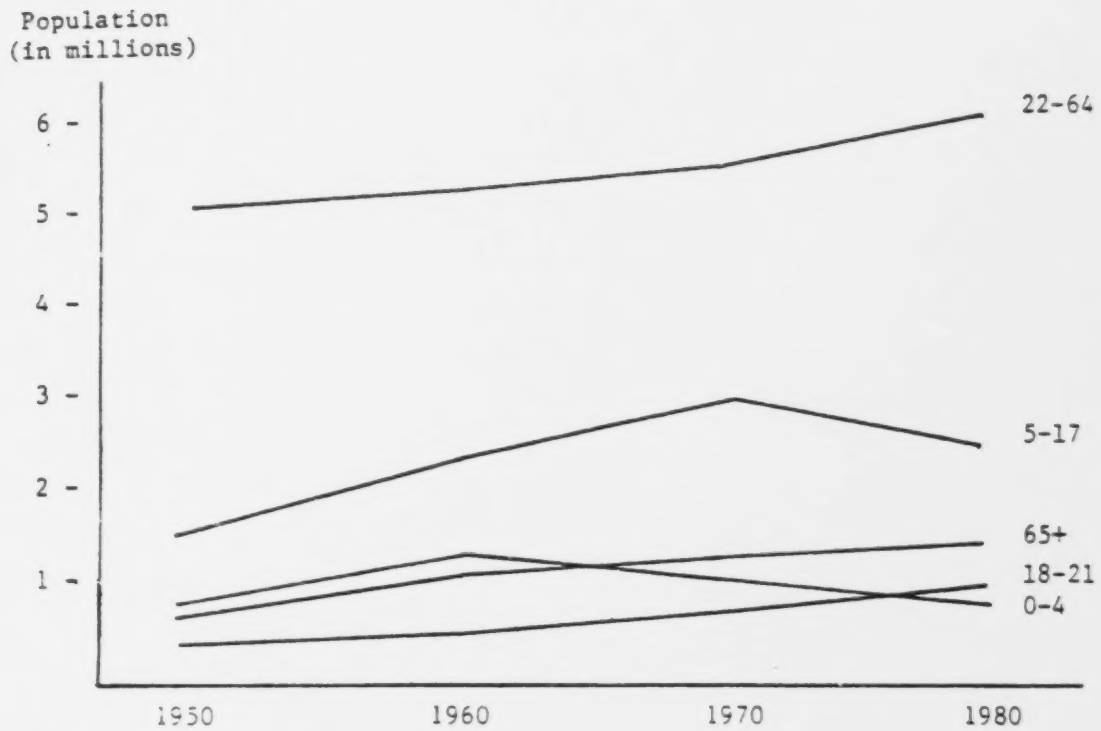


Since population growth or decline is a function of deaths, births and net migration, the historical trends reflect changes in these three components. Between 1960 and 1970, Illinois lost 43,000 persons in net migration; yet due to an increase of births over deaths, population growth during that time was over one million persons. Since 1970, Illinois has lost more than 900,000 people through migration, just under 700,000 for 1970 to 1980 and more than 210,000 for 1980 to 1983. Net out-migration for Illinois has been so substantial as to offset the natural birth-death surplus, causing a virtual stabilization of total population since 1972.

The small overall increase in population does not imply that each age group has experienced an increase in size. Certain age groups have experienced decreases in their population sizes. Figure 2 depicts the profile of historical changes in population sizes for five broad age groups in Illinois. While population increases for the age groups 18-21, 22-64 and 65 and over, the number of persons age 5-17 and 0-5 have declined in the decade of the 70s. The decline is particularly sharp for the age group 5-17. However, due to the echo effect of the "baby boom" generation, the growth of preschool age children is expected to increase in the next decade.

Figure 2

POPULATION OF SELECTED AGE GROUPS, ILLINOIS: 1950-1980

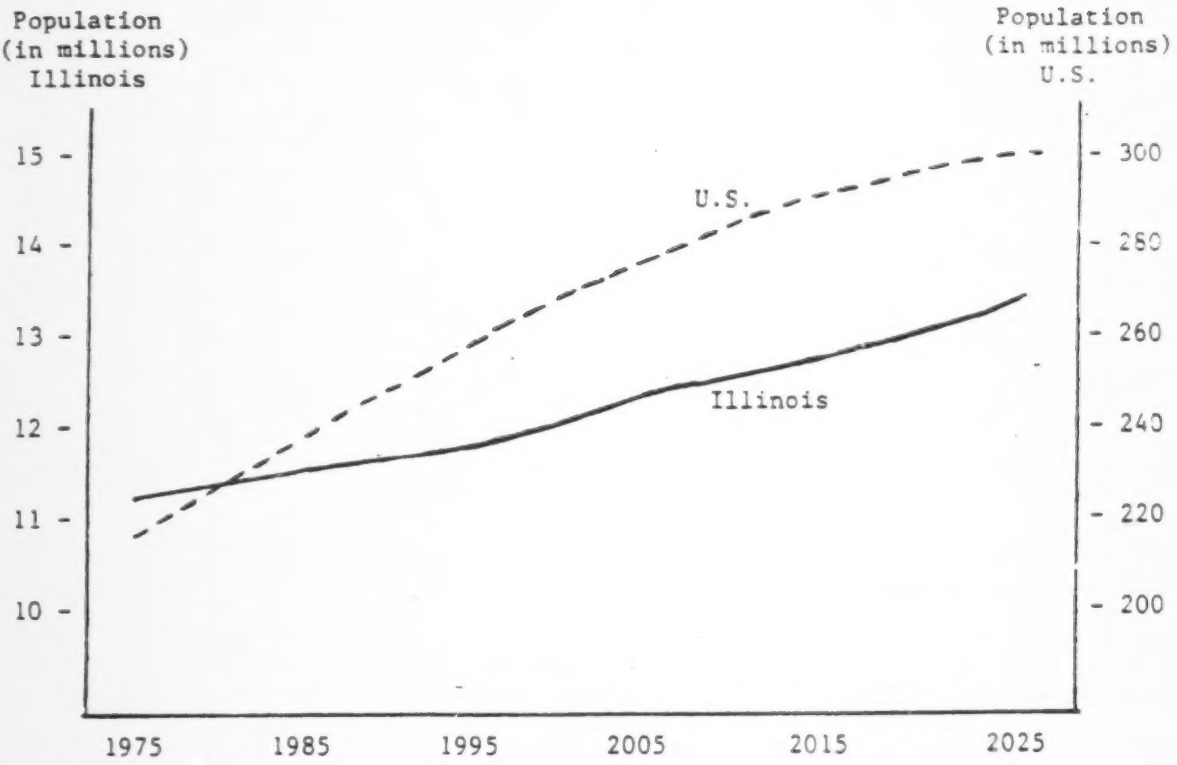


Future Population Trends in Illinois

The historical trends in population size and age composition provide essential clues to the questions of what future population size and age compositions are likely to be. Figure 3 depicts the projected populations of the State of Illinois and the U.S., at five-year intervals, until the year 2025.

Figure 3

POPULATION TRENDS IN ILLINOIS AND U.S.: 1975-2025



A comparison of the Illinois data with U.S. projections reveals that Illinois' lag in population growth relative to the rest of the country is expected to continue. During the 25-year period from 1975 to 2000, the population of Illinois is expected to increase about 8 percent, while the U.S. population will increase about 21 percent. However, this slower growth does represent a gain of almost 900,000 people for Illinois.

The age and sex distribution of the population will change substantially. To illustrate this change, Figures 4, 5 and 6 show the age/sex "pyramids" for Illinois in 1970 and projected pyramids for the years 2000 and 2025. An age/sex pyramid illustrates the percent of population accounted for by each age/sex group during the year presented. For example, in 1970, males aged 10 through 19 accounted for 9.7 percent of the population of Illinois.

As Figure 4 illustrates, the age distribution of the Illinois population during 1970 reflects a large percentage of the population among younger age groups, graphically represented by the large base. A natural decrease is reflected in each succeeding age group forming the pyramid. Two anomolies stand out. The age cohort representing those individuals who were 30 to 40 years old in 1970 is smaller than one might expect, reflecting extremely low fertility rates evident during the Great Depression. In addition, the 0 to 10 age

cohort is smaller than the 10 to 20 cohort, resulting from the decline in fertility rates during the period 1960 to 1970.

As Figure 5 illustrates, the age/sex distribution for the year 2000 in Illinois will be substantially different. By this time, the pyramid will have become more "cylindrical" as a result of lowered fertility rates. As births continue to account for less and less of the population, the median age of the State will continue to rise.

By the year 2025 (Figure 6), the continuing effects of these phenomena show that the age distribution of the population will have changed significantly. The age distribution will be approximately static as births continue at a replacement level. Unless fertility rates undergo a dramatic change, the age/sex pyramid should stabilize in Illinois between the years 2000 and 2025.

ILLINOIS PROJECTED OPEN POPULATION: 1970

AGE-SEX DISTRIBUTION

AGE-SEX DISTRIBUTION

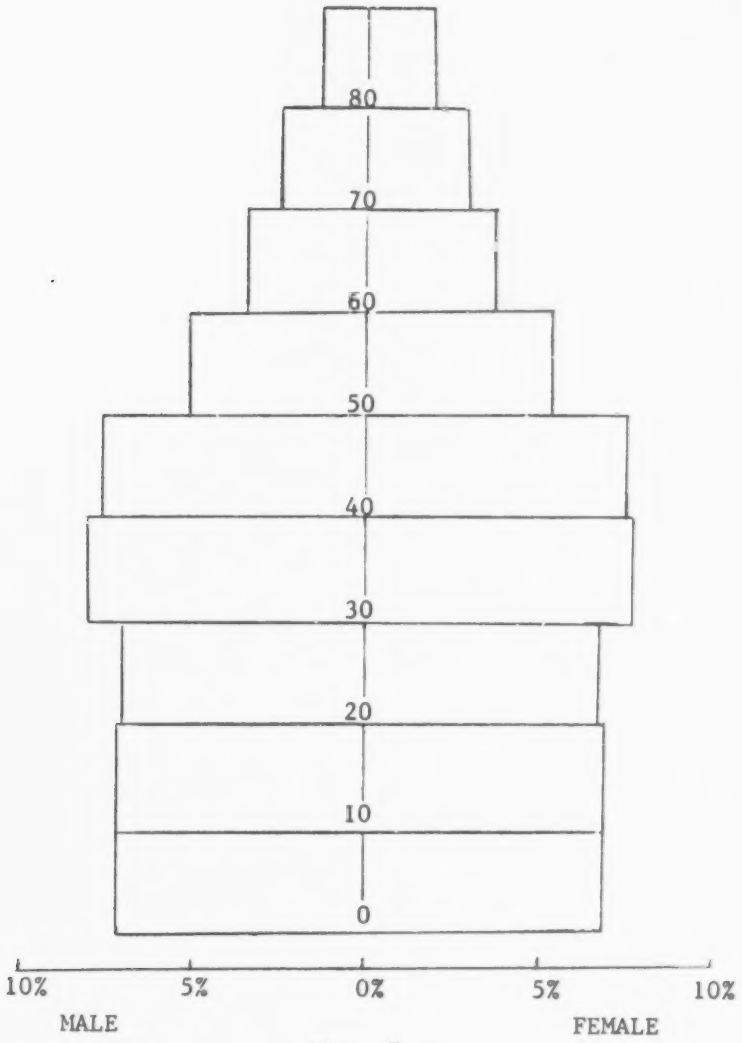

Fig. 5

ILLINOIS PROJECTED OPEN POPULATION: 2025

AGE-SEX DISTRIBUTION

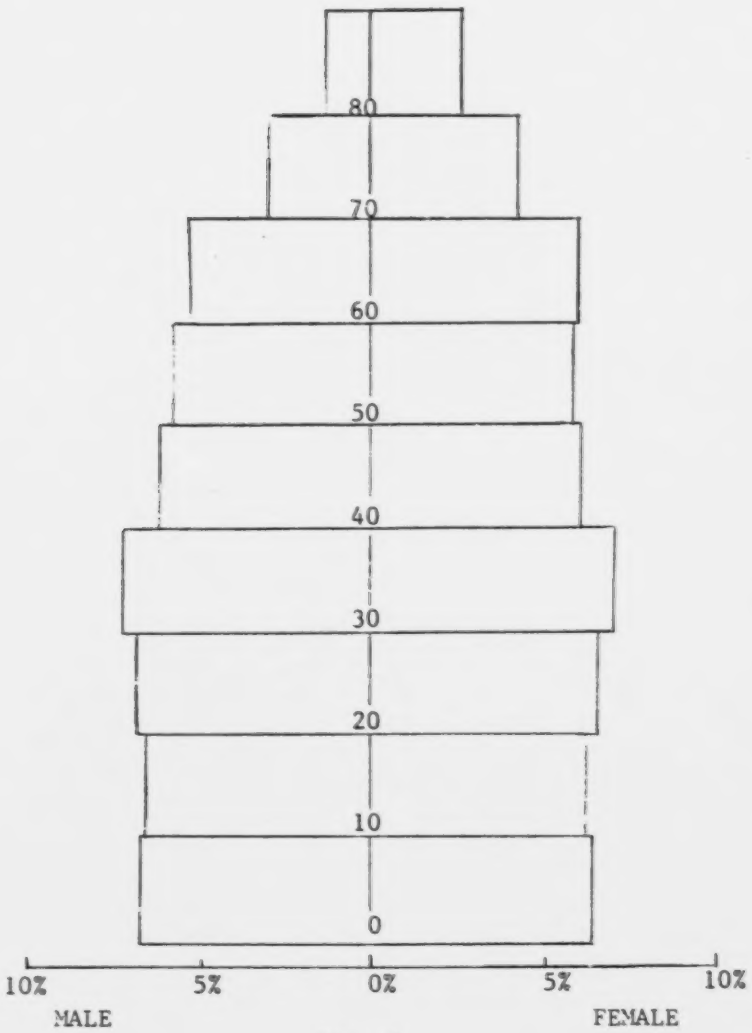

Fig. 6

Demographic information based on age breakdowns as shown in the pyramid is not specific enough for many planning purposes. Moreover, projections to the year 2025 may seem remote for current government policy. For both state and local governments, significant shifts in the size of four population groups in the next two decades are perhaps of particular importance: school aged children, young adults, the working population, and the elderly. The following sections illustrate changes that these groups will undergo during the period 1980 to 2000.

The School Aged Population (5-17)

From 1950 to 1970, the population of school aged children (ages 5-17) has increased in both the U.S. and Illinois. However, beginning in 1970, there is a decline due to the fact that five years earlier, in 1965, there was a decrease in the amount of children being born which marked the end of the "baby boom" generation. This decrease shows up in the school aged cohorts in 1970. The decrease in the population of children aged 5 to 17 continues until approximately 1990 where the number of school aged children is expected to increase, reflecting the echo effect of the "baby boom" generation.

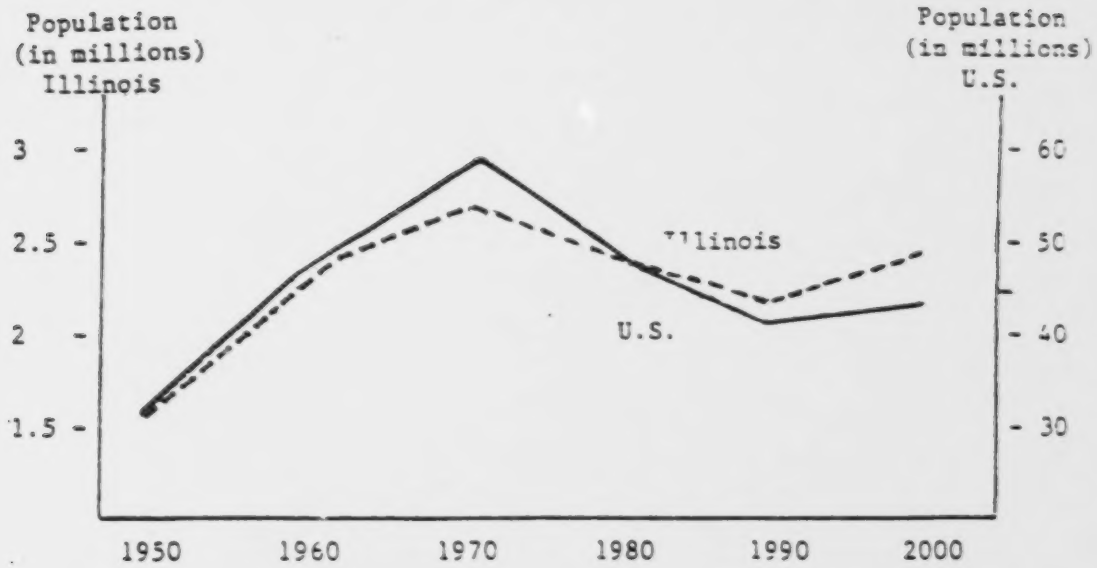
Table 1

NUMBER OF SCHOOL AGED CHILDREN BY AGE, ILLINOIS: 1970-2000

Year	Total	Population	
		5-13	14-17
1970	2,864,075	2,017,007	847,068
1980	2,410,104	1,585,717	824,387
1985	2,236,358	1,484,811	751,547
1990	2,146,949	1,462,640	684,309
1995	2,170,458	1,527,916	642,542
2000	2,239,784	1,561,917	677,867

Figure 7

SCHOOL AGED POPULATION, ILLINOIS AND U.S.: 1950-2000



The Young Adult Population (18-21)

From 1960 to 1975, the population aged 18-21 increased by 72 percent for Illinois. However, population in this age group has started to decline and will continue to do so until 1995 (Table 2 and Figure 8). By 1995, Illinois will have only 657,522 young adults, approximately 46,000 fewer than that for 1970. A similar pattern of change has also been projected for the U.S. by the Bureau of the Census (Figure 8).

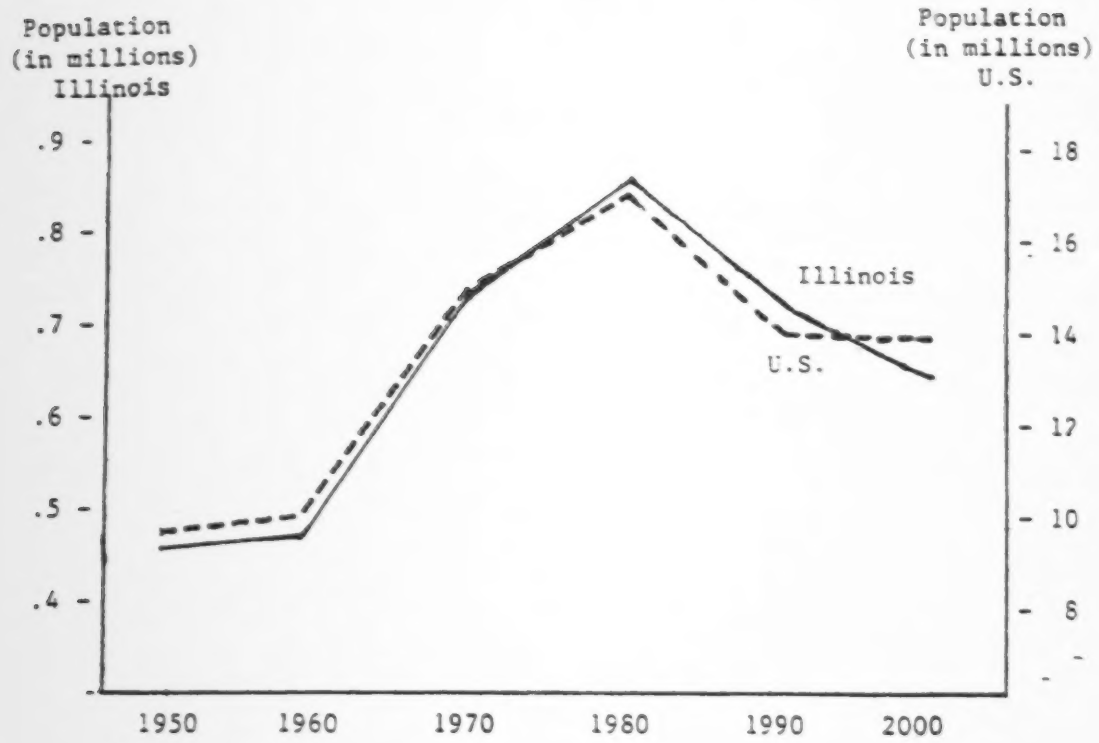
Table 2

NUMBER OF YOUNG ADULTS, ILLINOIS: 1970-2000

Year	Population
1970	728,251
1980	856,326
1985	794,776
1990	722,264
1995	657,522
2000	654,149

Figure 8

YOUNG ADULT POPULATION, ILLINOIS AND U.S.: 1950-2000



The decline in the young adult population will not only affect the number of college enrollments but may also lead to lower young adult unemployment rates and lower incidences of crime. Whether these anticipated effects will materialize depends upon future economic growth, the criminal justice system and other socio-economic factors.

The Working Population (22-64)

The age group 22 through 64 represents the majority of the members of the labor force. The size of the labor force is governed by the number of people in this age group and the participation of that group in the labor force. As Table 3 and Figure 9 illustrate, the population aged 22 through 64 will continue to climb for Illinois. While the total population is expected to increase by only 8.6 percent from 1970 to 2000 in Illinois, the age group 22 through 64 is expected to jump from 5.5 to 6.8 million, an increase of nearly 24 percent. However, the percent increase is far less than that for the nation as a whole. An increase of more than 45 percent during this period has been projected for the United States by the Bureau of the Census (Figure 9).

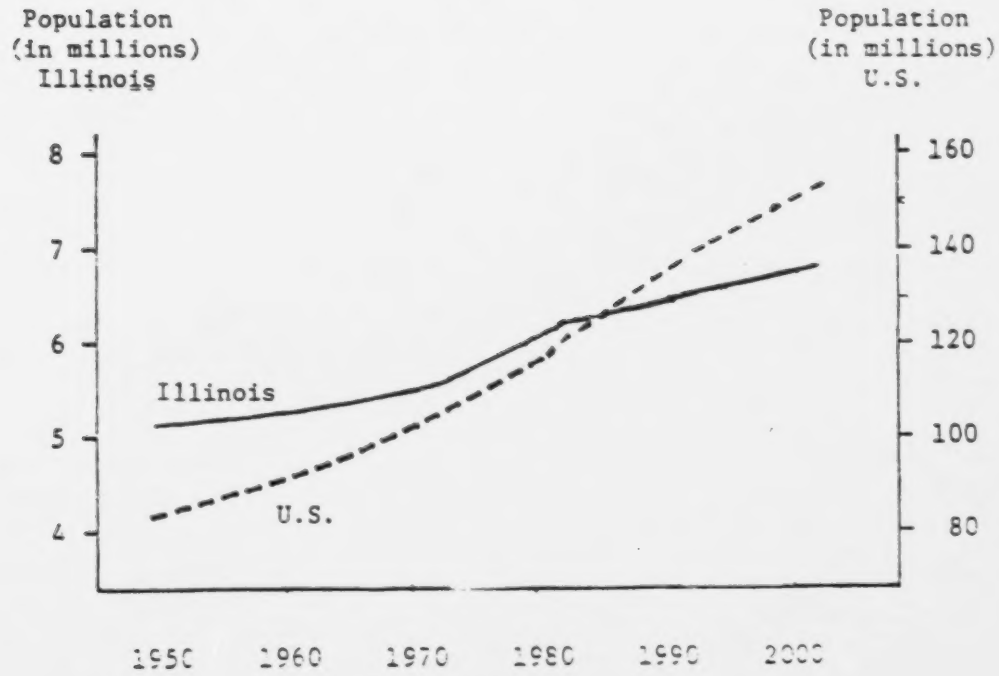
Table 3

POPULATION AGED 22-64, ILLINOIS: 1970-2000

Year	Population
1970	5,508,211
1980	6,059,360
1985	6,301,254
1990	6,437,719
1995	6,564,396
2000	6,802,333

Figure 9

POPULATION AGED 22-64, ILLINOIS AND U.S.: 1950-2000



This large relative increase in the 22 through 64 age group should have several positive outcomes for the Illinois economy. The labor force will be more mature than that found in the 1970s, with more work experience. This should tend to lead to productivity gains. Also, since earning power generally rises with age and experience, workers should earn more. This, of course, will yield increased economic benefits to all sectors of the Illinois economy, including state government. While overall economic growth, the occupational makeup of the labor force, and other factors complicate the relationship between state revenue growth and changes in the size and maturity of the State's labor force, the large maturing labor force should suggest a strong state government revenue base within the existing tax structure.

The Elderly (65 and over)

Since 1950, the number of people in Illinois over the age of 65 has grown from over 750,000 to more than 1.15 million in 1975. If current population trends hold, by 2000 there will be 1.54 million persons over the age of 65 residing in Illinois, an increase of 34 percent (Table 4 and Figure 10). This percent increase is less significant than that for the nation as a whole. The number of elderly in the U.S. will increase from 22 million to 34 million from 1975 to 2000, an increase of 55 percent.

Table 4

POPULATION AGED 65 AND OVER, ILLINOIS: 1970-2000

Year	Population
1970	1,095,721
1980	1,262,262
1985	1,371,793
1990	1,474,879
1995	1,536,257
2000	1,549,602

From 1950 to 1975, we have experienced not only an absolute increase in the number of elderly individuals in Illinois but also an increase in their percentage of the total population. The same thing can be said for the future (Figure 11). In 1970, persons over 65 years old constituted 9.9 percent of the Illinois population; the number of elderly individuals is projected to grow to over 12.8 percent of the population by the year 2000.

Figure 10

POPULATION OVER 65 YEARS OLD, ILLINOIS AND U.S.: 1950-2000

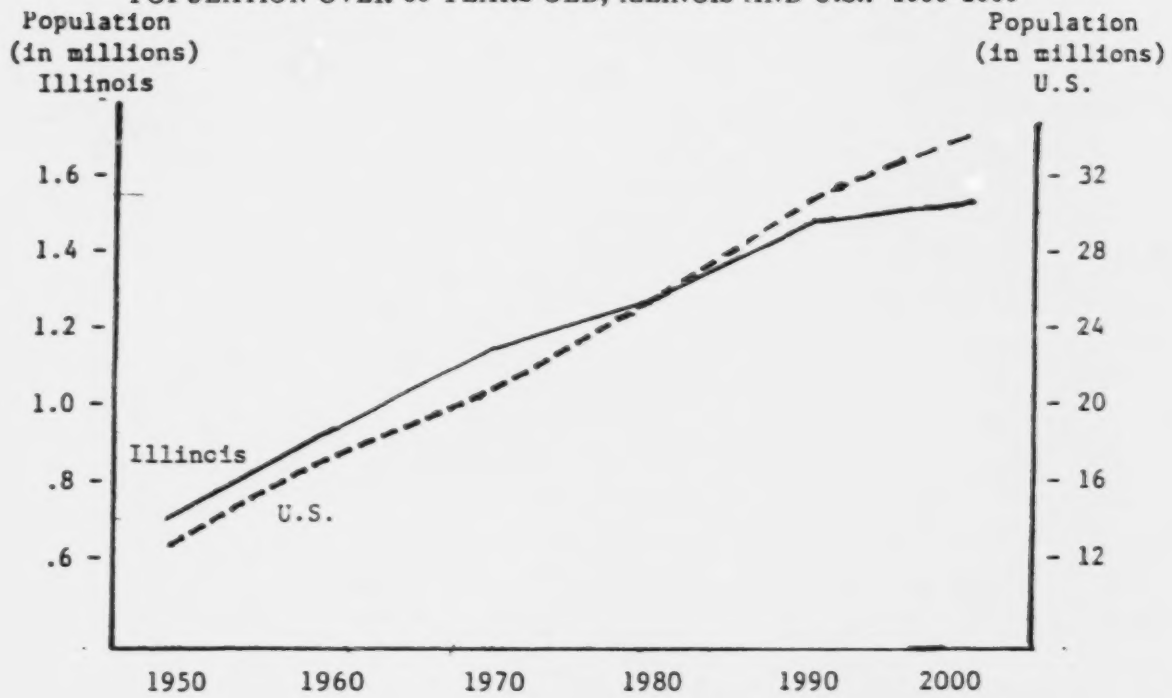


Figure 11

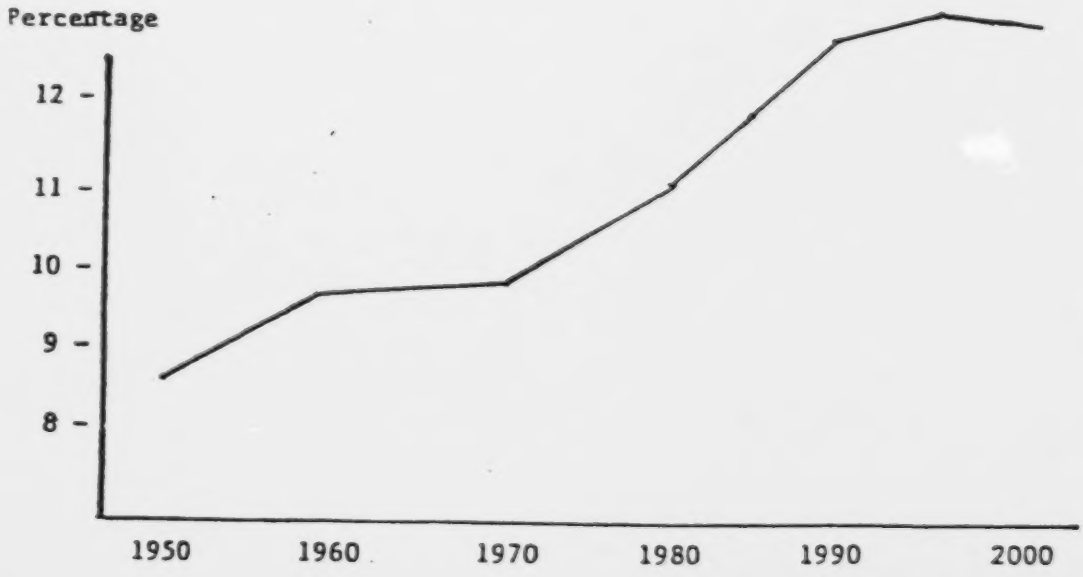
ELDERLY POPULATION AS A PERCENTAGE OF ILLINOIS TOTAL POPULATION: 1950-2000



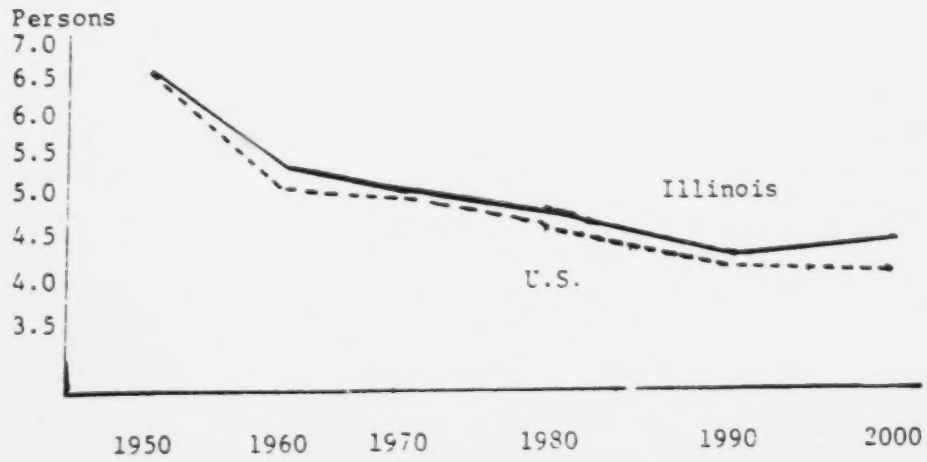
Clearly, there will be an increase in demand for government services for the elderly over the next 20 years. By the year 2000, the median age of the population of the U.S. will have shifted from 28.8 years in 1975 to 36.3 years of age. A similar shift will take place in Illinois, with the median age in the year 2000 estimated to be 37.5. This shift in the median age of the population will likely cause similar shifts in demand for a variety of government services. For example, the needs for long-term care and other health care services for the chronically ill will likely expand as the elderly population increases. In addition, the overall need for income maintenance and social services for the elderly - whose earning power has traditionally lagged behind the rest of the population - will increase if living conditions among senior citizens are to be maintained or improved. As the number of those over 65 in Illinois increase from 1,262,262 in 1980 to 1,536,257 by the year 1995, additional government resources will most likely be called upon to meet their needs.

Can resources produced by the prime-earning age population finance services necessary to support the increasing number of aged population? The future trend of the ratio of population aged 22 through 64 to those over 65 may provide us with a clue to the question.

For both Illinois and the U.S., the ratio has declined steadily from 1950 to 1970 (Figure 12). Illinois and the U.S. had almost identical numbers of persons aged 22 through 64 per aged individual in 1950 and 1960. Beginning in 1970, however, the ratio began to be in favor of Illinois. In 1980, Illinois had a ratio of 4.80 as compared to 4.77 for the U.S. While almost no change in the ratio is expected for Illinois in the next two decades, a steady decline in the ratio for the U.S. has been projected by the Bureau of the Census. As a result, the number of persons aged 22 through 64 per elderly individual for the U.S. will continue to lag behind that for Illinois. The future discrepancy in the ratio between Illinois and the U.S. is mainly accounted for by a more rapid growth in population over 65 in the U.S. relative to that in Illinois. The slower growth in population over 65 in Illinois may be associated with migration of the elderly to the sunbelt regions. Thus Illinois will have a more solid base of working people with which to provide services to the elderly than the U.S. as a whole.

Figure 12

RATIO OF PERSONS AGED 22-64 TO PERSONS AGED 65 AND OVER, U.S. AND ILLINOIS: 1950-2000



Summary

These population projections indicate that the future of Illinois will be strongly influenced by the following trends:

- slow population growth continues;
- early 1980's recession slowed down population growth through net out-migration;
- decreased school aged population until 1990, with moderate growth in school aged population thereafter;
- young adult population will decline until 1995, with moderate growth thereafter;
- continuing increases in absolute numbers and percentage of the elderly in the population; and
- Illinois will have a more solid base of working people with which to provide services to the elderly than the U.S. as a whole.

ILLINOIS BUREAU OF THE BUDGET

APPENDIX 1

METHODOLOGY

Historical Background

It is well known to demographers that large populations can be more accurately projected than smaller ones, all else being equal. It is also well known that there is a margin of error when projecting population. This margin of error remains the same whether projecting large populations or small populations. Therefore, the reason it is more difficult to project smaller populations is because the margin of error seems much larger when compared to the population size. Consequently, the basic projection system utilizes a general step-down procedure. That is, population projections were first made for the State of Illinois, then for sub-state regions within the State, then for counties within the regions. At all times, the sum of the counties' projections were forced to equal the regions' totals, and the regions were forced to equal the State's projections.

The fifteen sub-state economic regional boundaries were delineated by grouping the counties into economically unified aggregates. The Standard Metropolitan Statistical Areas (SMSA's) and their adjoining less populated areas formed the basis for nine of the regions. The other six were defined as broad, nonmetropolitan areas having similar economic infrastructures and tending to form analytically significant economic and demographic entities. While any number of regions with a multitude of boundary variations could have been drawn, these fifteen were considered to be sufficiently large so as to promote accuracy, yet sufficiently disaggregate so that each region did, in fact, represent a basic economic and social unit. For each of these economic regions and their constituent counties, population projections by age and sex have been prepared according to the following procedures.

Assumptions

- Economic assumptions for the U.S. are those of the Bureau of Labor Statistics in their Structure of the U.S. Economy to 1985 series. The specific model used assumed a national unemployment rate of 5.5 percent by 1985.

- National fertility rates assumed to be in effect are the Series II rates of the Census Bureau. National mortality rate trends utilized are also those of the Census Bureau.

- There will not be any water shortages in Illinois that might inhibit industrial and population growth.

In developing population, labor force, and migration parameters, the following data sources have been used as the primary sources.

- Data for 1970 is from the 1970 Census of Population. Census Bureau Current Population Reports p-20, p-23, p-25, p-26, p-27 were utilized

to update the basic data for the intervening years 1970-78. Data derived from the 1980 Census were utilized to update the previously projected 1980 total population for state and each county. Census of population data reflects the situation as of April 1 of the decade year. Since all intermediate population data are estimated as of July 1, the precise decennial Census values will not match the historical data shown on these projections.

- Labor force participation rates by age, sex and race for Illinois and its constituent counties were projected on the basis of the most current projected rates by the Bureau of Labor Statistics.

- Historical data on deaths by age and sex, and births by age of mother in Illinois are available from state vital statistics reports prepared by the Illinois Department of Public Health. Census Bureau Current Population Reports p-25 was utilized to estimate future age-specific fertility and mortality rates in Illinois.

- Net migration patterns by age and sex by county between 1975 and 1980 were estimated by comparing the derived estimated (1980) closed populations with the revised open populations for 1980.

Economic/Demographic Projections

In making the economic/demographic projections, the following sequential work plans have been followed: (1) employment projections, and (2) population projections. According to the model used, these projections have their operational priorities as specified. The methodologies concerning these projections are briefly described as follows: In order to facilitate the dissemination of the projected data, a flexible and comprehensive reporting system has been developed from which State agencies may retrieve the information compiled by the Economic/Demographic Unit and the State Data Center of the Division of Planning and Financial Analysis.

Employment Projections

Employment opportunities are assumed to be the driving force for migration. Considerable emphasis and care were taken in the development of the industrial projections for the State and substate regions. In general, the projections have been developed using simultaneous least squares technique in the regression format.

- Historical employment data for Illinois and U.S. total and one-digit SIC levels from 1952-1979 were utilized for regression analysis. This data was obtained from Bureau of Labor Statistics Employment and Earnings. Historical Illinois and U.S. population data from 1952-1979 were also utilized for simultaneous determination in the regression analysis. The population data took the form of an Illinois to U.S. ratio and was obtained from Illinois Population Trends from 1970 to 2025 and the U.S. Bureau of the Census, Statistical Abstract of the United States

1981. Thus, eight separate two-stage least squares regression equations were computed, one for each one-digit SIC Illinois to U.S. employment ratio and total employment, (as the dependent variable). Included, as explanatory variables in the reduced form equation for Illinois to U.S. employment were "time" and the Illinois to U.S. population ratios mentioned above.

- The resulting estimated coefficients were examined for a "goodness of fit." The estimated slopes of the Illinois to U.S. employment shares, together with U.S. total and one-digit employment levels and the Illinois to U.S. population ratios for 1980 yielded results closer to those reported as actual by the Bureau of Labor Statistics in their publication, Employment and Earnings then did the coefficients estimated by the existing employment projections model for all the major-sectors except mining.

- From this point in the model, employment projection sets made utilizing the revised methodology will follow the procedure described below for computing State two-digit and county one- and two-digit employment: A weighted average ratio of Illinois subsector, (two-digit SIC) to major-sector (one-digit SIC) is computed based on the historical levels for the years 1976-1980. Based on these subsector to major-sector weighted average ratios, State two-digit employment is calculated by disaggregating the projected major-sector levels. It should be noted that because agricultural employment is considered a major-sector level in itself with no subsector categories, and because no accurate or consistent historical data was available on agricultural employment at either the State or U.S. levels, projected agricultural employment for the State is computed as a ratio of State total employment.

- County two-digit or subsector employment will then be computed based on a weighted average ratio of county to State subsector employment for the years 1976-1980. These subsector ratios will be multiplied by projected State subsector levels to computed county subsector employment.

- County major-sector or one-digit employment levels will be computed through a step-up technique. By aggregating the previously computed county subsector or two-digit employment levels into their respective one-digit or major-sector categories, county one-digit SIC employment is calculated.

- County total employment is also computed utilizing a step-up technique. By aggregating the computed county major-sector employment levels, (and agriculture employment) projected county total employment is calculated.

- To assure numerical continuity, county subsector, major-sector, and total employment levels are aggregated and the respective State sectors are adjusted or forced to equal their sum.

Population Projections

The projections of population and labor force by region and county are derived through the use of the cohort-survival method in which the three components of population change: (births, deaths, and net migration) are projected separately. Since fertility and mortality rates change only gradually, the Series II projections (middle level projections) of these two rates by the Bureau of the Census often provides reasonable trends from which closed population, (population accounting only for births and deaths) can be meaningfully projected. It is the different migration assumptions that differentiate one set of population projections from another.

Migration projections are based upon the following concepts and techniques:

1. Net migration is viewed as, and is projected from the standpoint of being, the social phenomena that equates a balance between labor force supply and labor force demand.

2. Labor force supply is estimated from the closed population. The sex and race specific age cohorts of the closed population yields labor force age population; i.e., those persons in age categories that are eligible to seek jobs. Labor force participation rates are projected in a manner similar to the fertility and mortality rate projections. These projected labor force participation rates are applied to the labor force age population to estimate the actual labor force supply.

3. Labor force demand is estimated on the basis of projected total employment, dual job holdings, unemployment, and net commutation. The total labor force for the base year is used as the starting point. From this count, the number of people serving the armed forces is subtracted, as it is felt they are not subject to the same market constraints as the rest of the economy. From this number, the unemployed are taken out to yield civilian job holders. This number is divided by the number of jobs for the region to derive the ratio of people employed to employment. This ratio is used to account for dual job holdings and net commutation. Then the ratio is multiplied by the employment projection to yield an estimate of future labor force demand, to which unemployment and armed forces projections are added. The number yields the total labor force demand for the projection year.

4. Labor force supply and labor force demand are compared to derive a measure of either labor oversupply (leading to net out-migration) or labor shortage (contributing to net in-migration). To in- or out-migrate sufficient labor force age population to balance out the supply and demand, the difference in supply and demand as a proportion of the total labor force is applied to the closed population. This yields total net migration. A shift-share algorithm is then used to break down the age, race, and sex components according to past migration patterns.

5. The age, race, and sex elements of the estimated net migration are then added to, or subracted from, the closed population to obtain the regional open populations.

6. Counties are projected in a similar manner and justified to regional totals.

7. This procedure is reiterated for each five-year period to obtain the series of projections.
